

Detect Fake Currency, Credit Cards, Driver's Licenses and More

Nashua's Line of Loss Prevention Products:

Fraud-U-Lite

A full spectrum UV light that helps prove authenticity of U.S. currency, traveler's checks, major credit cards and even most driver's licenses. It plugs into a standard 110V outlet, giving you an easy way to inspect products produced with UV ink protection (including all the documents named above and more!). Pass the documents under the Fraud-u-Lite beam to detect UV ink markers. Its small footprint (just 6" x 4" x 3") makes it easy to fit into most retail environments.

Security stripes in U.S. bills will change color as follows:

\$100 bill – red \$50 bill – yellow \$20 bill – green
\$10 bill – orange \$5 bill – blue

Mini-UV Light

A handy, easy-to-use tool featuring a UV beam to detect security images or markers embedded in most U.S. currency and on major credit cards, traveler's checks and driver's licenses. It can also detect UV-sensitive inks printed on custom receipt rolls. Tiny enough to fit in your pocket, it can even be used as a key chain.

Jumbo Counterfeit Detection Pen

An easy, economical and effective way to avoid fake currency. Simply make a small mark on the bill and if the ink turns dark brown or black, the bill is suspect. Retailers then may request another bill to pay for the purchase. The pen lasts for up to 30,000 impressions and features a specially designed tip to prevent drying if left uncapped.

UV Marker

An economical and convenient device for tracking documents or objects. This felt tip marker applies invisible UV ink to money, merchandise, or any other item which you suspect may be pilfered by employees or stolen and sold at flea markets or through other distributors. Use our mini-UV light or any other black light to make the invisible ink appear.

More Theft- and Fraud-Deterrent Products from Nashua

3-D Foam Label

Silver Barcode Label

Security Dot shown in silver (also available in holographic prism)

Barbell Label shown in silver (also available in holographic prism)

Non-Active Security Labels

An inexpensive yet effective added level of theft protection for low-end items that don't warrant the cost of a live security tab. Small yet noticeable, these tags are proven deterrents to shoplifters. Easily attached to nearly any product, they let retailers make impulse-buy items accessible to customers while discouraging amateur shoplifters.

Fingerprint Pad

Identity fraud is a big problem that is only getting bigger. Our fingerprint pad uses ink developed especially for making smudge-free prints to protect the retailer from thieves who try to pass counterfeit checks, fake legal documents or use phony identification. The pad can produce over 20,000 prints for digital scanning and helps to protect stores from identity scam artists. Its small size makes it perfect for check-cashing sites, law offices, businesses or schools where validating identity is essential.

6X Magnifying Loupe

Designed for quick and easy identification of counterfeit printed documents, the Magnifying Loupe can detect the difference between a commercial POS matrix 9-pin printer and a counterfeit receipt printed on an inkjet or 24-pin matrix printer. It also can identify legitimate documents printed on offset printers vs. counterfeit documents printed on inkjet or laser printers. Its durable metal and glass construction as well as its compact size (folds to less than .5") ensure long life.

Laser Lock System

Laser Lock System uses a hand-held laser and a laser-sensitive compound that is invisible to the human eye except when viewed under the laser. Laser Lock allows a retailer to quickly determine whether returned goods were legitimately purchased or stolen.
